Skills

Backend: Java, Spring Boot, Spring Security, REST APIs, Microservices, JWT, RBAC
Database: PostgreSQL, SQL, Hibernate, JPA, JPQL, Query Optimization
DevOps: Docker, Kubernetes, GitHub Actions, CI/CD, MinIO
AI/Tools: Spring AI, OpenAI APIs, RAG, SSE, Git, Maven, Postman

Experience

Harman International

Jul 2023 – Present

Engineer 1

- Designed, developed, and deployed a **high-performance multithreaded Java data processing pipeline** leveraging **Core Java concurrency (ExecutorService)** to transform large-scale CSV datasets into structured **JSON payloads** for **RESTful API ingestion**, improving processing throughput by **60%+** and enabling reliable **high-volume data onboarding**.
- Architected and implemented a **Java-based computational plugin** for recycled parts analysis, optimizing **business rule execution**, reducing calculation errors by **15%**, and improving processing performance by **25%**, strengthening **data accuracy** and **traceability**.
- Built and deployed a **scalable Spring Boot microservice** using **Spring Boot REST APIs**, **ExecutorService-based multithreading**, and **Apache POI** to process complex **hierarchical BOM (Bill of Materials)** datasets across multiple currencies, achieving **4× faster report generation** and enhanced **system scalability**.
- Designed and developed **Spring Boot REST APIs** for dynamic business report generation with **hierarchical filtering**, **multi-level indentation**, and **conditional formatting (color-coding)** in Excel reports, improving reporting efficiency by **40%**.
- Engineered **enterprise system integration** by developing secure and scalable **Spring Boot REST APIs** enabling seamless **data exchange**, **synchronization**, and **interoperability** between distributed systems.
- Led **end-to-end data migration** from legacy to target systems by implementing **Python-based data transformation pipelines** and leveraging **Spring Boot REST APIs** for data loading, ensuring **data consistency**, **high availability**, and seamless **system transition** with minimal downtime.

AjnaLens

Sep 2020 – Oct 2020

Unity Developer

- Improved** the user interface (UI) of the Ajnasuite APK to make it more user-friendly and efficient.
- Achieved** a 15% reduction in UI-related issues, indicating fewer bugs or user interface problems, and a 10% increase in user engagement, suggesting that users found the UI improvements more appealing or easier to use.
- Designed and implemented** a new functionality that allows users to teleport within the application.
- Implemented** a feature where objects are dynamically loaded or spawned in real time based on data retrieved from **Firebase**, a cloud database.

Education

National Institute of Technology (NIT), Hamirpur

Bachelor of Technology in Electronics and Communication Engineering

CGPA: 8.33

Projects

BuildifyAI ↗

Jan 2026 – Present

- Architected a modular **Spring Boot backend** for an **AI code generation platform** covering authentication, project management, AI chat, collaboration, billing, and usage tracking; containerized with **Docker Compose** using **PostgreSQL/pgvector** and **MinIO**.
- Secured APIs with **stateless JWT authentication** using **JJWT 0.12.6**, **BCrypt**, **Spring Security**, and **OncePerRequestFilter**; implemented project-level **RBAC** with **ProjectRole**, **ProjectPermission**, **@PreAuthorize**, and custom **SpEL** methods for fine-grained access control.
- Built reactive **AI streaming APIs** with **Spring AI ChatClient**, **Reactor Flux**, and **Server-Sent Events**; integrated OpenAI-compatible LLMs via **OpenRouter** with tool calling, file-tree context injection, and replayable **ChatSession**, **ChatMessage**, and **ChatEvent** history modeling.
- Persisted **LLM-generated artifacts** in **MinIO** with **PostgreSQL** relational metadata; implemented async post-stream finalization via **Reactor Schedulers.boundedElastic()** for token usage tracking, file-edit tag parsing, and chat record persistence.
- Delivered full **Stripe subscription lifecycle** including checkout, webhooks, renewal, and cancellation; enforced plan-based project limits and daily token quotas.
